METARIS

MA10V0VSO TECHNICAL CATALOG

THIS CATALOG REPLACES OUR PREVIOUS PISTON CATALOGS. ALL PREVIOUS METARIS PISTON CATALOGS IN YOUR POSSESSION SHOULD BE DESTROYED.

Features

Axial piston pump MA10VO in swashplate design is used in open loop circuits. Flow is proportional to drive speed and displacement. By adjusting the position of the swashplate it is possible to smoothly vary the output flow of the pump.

- Port connections to SAE or metric
- 2 case drain ports
- Operating pressure 4000PSI (280 bar)
- Good suction characteristics
- Low noise level
- High power/weight ratio
- Long service life
- Short control times
- Axial and radial loading of drive shaft possible
- Wide range of controls
- Through drive option for multi-circuit system
- SAE & ISO mounting flanges available

Technical Data

1. Input Operating Pressure Range

Absolute pressure at port S (A)
 Pabs min 11.6 PSI or (0.8 Bar)
 Pabs max 435 PSI or (30 Bar)

2. Output Operating Pressure Range

Pressure at port B
 Nominal pressure P_N 4000 PSI or (280 Bar)
 Peak pressure P_{max} 5070 PSI or (350 Bar)

3. Case Drain Pressure

The maximum pump case drain pressure measured at ports L, L1 is 7 PSI (0.5 Bar) higher than the input pressure at ports S, but not exceeding more than 30 PSI (2 Bar) absolute.

4. Direction of Flow

("S" inlet port to "B" pressure port)

5. Table of values (theoretical values, without considering η_{mh} and η_v ; values rounded)

Size			18	28	45	71	100	140		
Displacement	V_{gmax}	cm ³	18	28	45	71	100	140		
Max. Speed	at V_{gmax}	n_{omax}	rpm	3000	3000	2600	2200	2000	1800	
Max. flow	at n_{omax}	Q_{omax}	L/min	59.4	84	117	156	200	252	
Max. power	$\Delta p = 4000$ psi ($\Delta p = 280$ bar)	at n_{omax}	P_{omax}	kW	27.7	39	55	73	93	118
Max. torque	$\Delta p = 4000$ psi ($\Delta p = 280$ bar)	at V_{gmax}	T_{max}	Nm	58.3	125	200	316	445	623
Weight (without fluid)		m	kg	26.5	15	21	33	45	60	

Notes: Values shown are valid for an absolute pressure of 1 bar at suction port. If the flow is reduced or if the inlet pressure is increased the speed may be increased.

Hydraulic Formula

6. Determination of Size

Imperial
 Flow $Q = \frac{V_g \cdot n \cdot \eta_v}{231}$ gpm

Metric
 Flow $Q = \frac{V_g \cdot n \cdot \eta_v}{1000}$ L/min

Torque $T = \frac{V_g \cdot \Delta p}{24 \cdot \pi \cdot \eta_{mh}}$ lb-ft

Torque $T = \frac{V_g \cdot \Delta p}{20 \cdot \pi \cdot \eta_{mh}}$ Nm

Power $P = \frac{Q \cdot \Delta p}{1714 \cdot \eta_t}$ HP

Power $P = \frac{Q \cdot \Delta p}{600 \cdot \eta_t}$ kW

V_g = geometric displacement cu.in. or [cm³] per rev.

Δp = differential pressure PSI or (Bar)

n = speed [rpm]

η_v = volumetric efficiency

η_{mh} = mechanical-hydraulic efficiency

η_t = total efficiency ($\eta_t = \eta_v \cdot \eta_{mh}$)

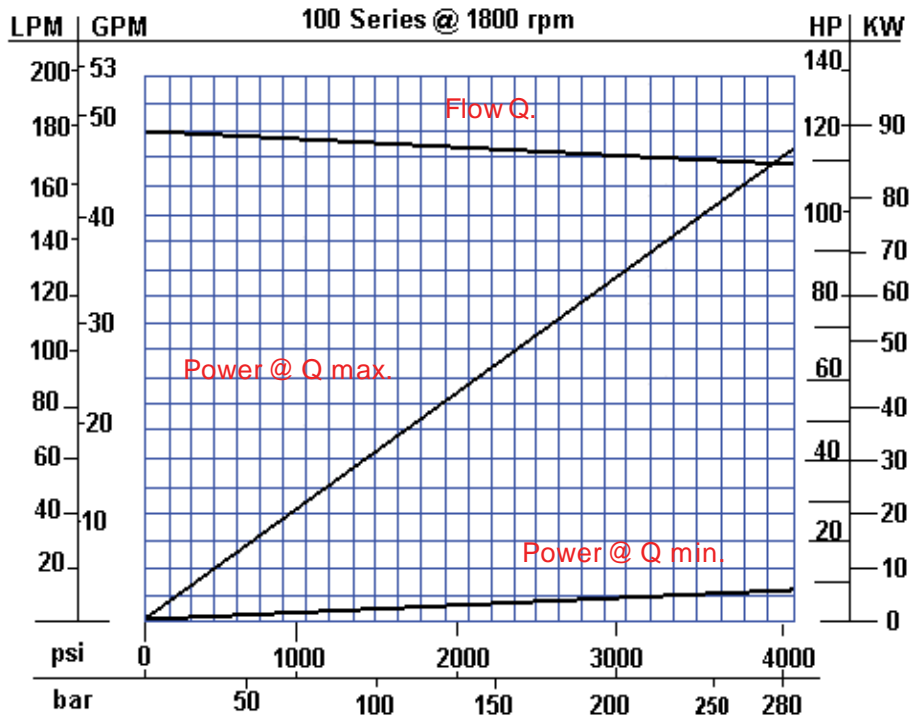

Q = Flow (gpm) or (L/min.)

Performance Information

Performance Information - *cont'd*

Performance Information - *cont'd*

Size 140
 — n = 1800 rpm

Total efficiency:

Imperial	Metric
$\eta_t = \frac{Q \cdot P}{P_{Q \max} \cdot 1714}$	$\eta_t = \frac{Q \cdot P}{P_{Q \max} \cdot 600}$

Volumetric efficiency:

$$\eta_v = \frac{Q}{Q_{\text{theor.}}}$$

Multiple Pumps

1. If a second Metaris hydraulic pump is to be factory-mounted, then both ordering codes are to be specified, combined with a "+". Ordering code 1st pump + Ordering code 2nd pump. Ordering example: MA10VO71DR/31R-PSC62K02 + MA10VO28DR/31R-PSC62N00
2. If a gear pump is to be factory-mounted please contact Metaris support staff.

Fluid

1. Hydraulic Fluid

The MA10V open loop pump in the standard design should be used with a good quality, petroleum based anti-wear hydraulic fluid.

2. Operating Viscosity Range

In order to obtain optimum efficiency we recommend that the operating viscosity be selected from within the range.

At operating temperature

Optimum viscosity (ν_{opt}) __80...170 SUS (16 / 36 mm²/s)

Limits of viscosity range

The following values are valid for extreme operating conditions:

$\nu_{min} = 60$ SUS (10 mm²/s)

for short periods at max. leakage oil temperature of 93° C

$\nu_{max} = 4600$ SUS (1000 mm²/s)

1400 SUS (300 mm²/s) on short term cold start

3. Temperature Range

$t_{min} = -15^{\circ}\text{C}$; $t_{max} = +80^{\circ}\text{C}$.; $t_{min} = -5^{\circ}\text{F}$; $t_{max} = +175^{\circ}\text{F}$

Filtration

In order to ensure reliable operation of the axial piston unit, the operating fluid must be maintained to a cleanliness class of 18/14 to ISO4406 or NAS 1638 class 9. As a guide the fluid cleanliness level may be achieved using a 10 micron filter.

Installation Information

The pump housing must be filled with clean hydraulic fluid prior to pump start up and remain full.
The concentricity between the prime mover drive shaft and the pump shaft 0.05mm.

Installation Information - *cont'd.*

The installation position of the pump is optional.

The pump housing must be filled with fluid both when commissioning and in operation. In order to achieve low noise levels, all connecting lines (inlet, case drain) should be isolated from the tank by flexible lines.

1. Vertical installation the following conditions should be noted:
 - Before installing the pump inside a tank fill the pump case with fluid
 - Make sure the ports are below the oil level (L), (L1) & S
 - Avoid mounting above the tank whenever possible in order to maintain a low noise level
 - The permissible inlet height is a result of the overall pressure loss "A" may not be greater than 32 inches (800 mm)

2. Horizontal Installation
 - The pumps must be install so (L) or (L1) the case drain is at the top of the pump
 - If the minimum fluid level is below the ports of the pump, pipe the ports L or L1 & S below the minimum oil level.
 - Avoid mounting above the tank whenever possible in order to maintain a low noise level.
 - The permissible inlet height (h) is a result of the overall pressure loss, "A" may not be greater then 32 inches (800 mm).

Below the tank position

- Pipe "L", "L1" and "S" must be mounted below the oil level

DR Pressure Control

The pressure control serves to maintain a constant pressure in the hydraulic system, within the control range of the pump. The pump therefore supplies only the amount of hydraulic fluid required by the actuators. Pressure may be smoothly set at the control valve.

Statis operating curve

DRG Pressure Control, Remote Control

Size 18 to 100

Function and design as for DR

A pressure relief valve may be externally piped to port X for remote control purposes. It is not, however, included with the DRG control.

The differential pressure at the pilot valve is set as standard to 20 bar and this results in a pilot flow of 1,5 L/min. If another setting is required (in the range 10-22 bar), please state this in clear text.

The remote pilot valve should be mounted no more than 78in (2 meters) from the pump.

DRG 140

DFR/DFR1 Pressure/Flow Control

In addition to the pressure control function, the pump flow may be varied by means of a differential pressure at the actuator (e.g. an orifice).

In model DFR1 the X orifice is plugged.

Ports

B	Pressure Port
S	Suction port
L, L1	Case drain ports (L1 sealed)
X	Pilot pressure port

Static curve
at 1500 rpm temp 120 F/ 49C

DFR/DFR1 Pressure/Flow Control - *cont'd*

Flow Control/Differential Pressure Δp :

Adjustable between 10 and 22 bar (higher values on request). Standard setting: 14 bar. If a different setting is required, please state in clear text.

When port X is unloaded to tank, a zero stroke pressure of

$p = 18 \pm 2$ bar ("stand by") results.

Static curve at variable rpm

DFLR Pressure/Flow/Power Control

In order to achieve a constant drive torque with a varying operating pressure, the swivel angle and with it the output flow from the axial piston unit is varied so that the product of flow and pressure remain constant.

Flow control is possible below the limit of the power curve.

Ports

B	Pressure Port
S	Suction port
L, L1	Case drain ports (L1 sealed)
X	Pilot pressure port

The power characteristic is factory-set, so please enter details in clear text, e.g. 20 kW at 1450 rpm.

There are four spring arrangements used for the power valve set-up refer to the chart below.

- Spring group A to 1300 psi/90 bar
- Spring group B to 2320 psi/160 bar
- Spring group C to 3480 psi/240 bar
- Spring group D over 3480 psi/240 bar

Control data

For pressure control technical data see DR Pressure control.

For flow control technical data see DFR control.

Through Drive

Axial piston unit MA10VO can be supplied with a through drive, as shown in the ordering code on page 7 & 8.

The type of through drive is determined by codes (K01-K17). If the combination pump is not mounted in the factory, the simple type code is sufficient.

Included with the pump are: Coupling sleeve, seals and necessary hardware.

Combination pumps

By mounting combination pumps circuits independent of each other are available for use.

1. If the combination pump consists of 2 MA10VO pumps and if these are to be delivered ready assembled, then the two type codes are to be combined with a "+".

Ordering example: MA10VO71DR/31R-PSC62K02 + MA10VO28DR/31R-PSC62N00

2. If a gear pump, vane or other type pump is to be mounted in the factory as a second or third pump, please consult the factory for available mounting information.

Mounting flange for SAE D 4 hole MA10V140

Ordering code K17

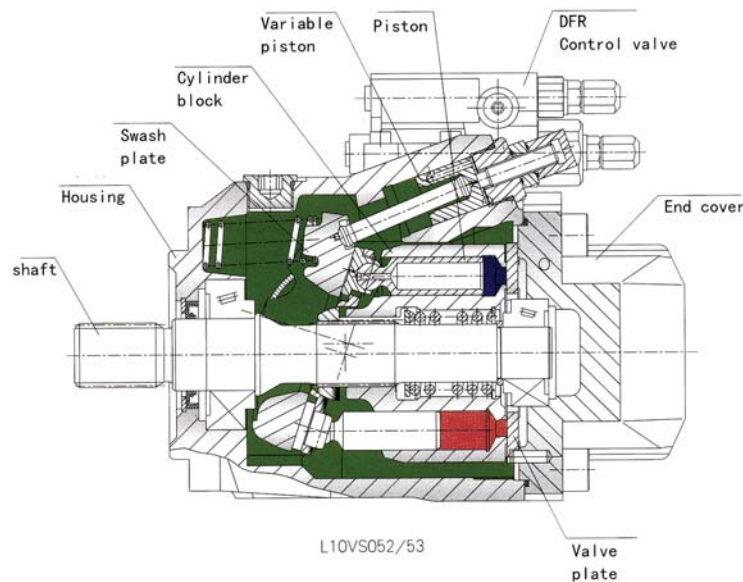

Features

Axial piston pump MA10VO in swashplate design is used in open loop circuits. Flow is proportional to drive speed and displacement. By adjusting the position of the swashplate it is possible to smoothly vary the output flow of the pump.

- Port connections to SAE or metric
- 2 case drain ports
- Operating pressure 3625 psi (250 bar)
- Good suction characteristics
- Low noise level
- High power/weight ratio Long service life
- Short control times
- Axial and radial loading of drive shaft possible
- Wide range of controls
- Through drive available
- SAE & ISO mounting flanges available

Technical Data

1. Input Operating Pressure Range

Absolute pressure at port S (A)
 Pabs min 11.6 PSI or (0.8 Bar)
 Pabs max 435 PSI or (30 Bar)

2. Output Operating Pressure Range

Pressure at port B
 Nominal pressure P_N 3625 PSI or (250 Bar)
 Peak pressure P_{max} 4500 PSI or (315 Bar)

3. Case Drain Pressure

The maximum pump case drain pressure measured at ports L, L1 is 7 PSI (0.5 Bar) higher than the input pressure at ports S, but not exceeding more than 30 PSI (2 Bar) absolute.

4. Direction of Flow

(“S” inlet port to “B” pressure port)

5. Table of values (theoretical values, without considering η_{mh} and η_v ; values rounded)

Size				45	60
Displacement		V_{gmax}	cm ³	45	60
Max. Speed	at V_{gmax}	n_{omax}	rmp	2600	2700
Max. flow	at n_{omax}	Q_{omax}	L/min	117	162
Max. power	at n_{omax}	P_{omax}	kW	49	68
Max. torque	at V_{gmax}	T_{max}	Nm	179	238
Weight (without fluid)		m	kg	18	22

Notes: Values shown are valid for an absolute pressure of 1 bar at suction port. If the flow is reduced or if the inlet pressure is increased the speed may be increased.

Hydraulic Formula

1. Determination of Size

Imperial
 Flow $Q = \frac{V_g \cdot n \cdot \eta_v}{231} \text{ gpm}$

Metric
 Flow $Q = \frac{V_g \cdot n \cdot \eta_v}{1000} \text{ L/min}$

V_g = geometric displacement cu.in. or [cm³] per rev.

Δp = differential pressure PSI or (Bar)

n = speed [rpm]

η_v = volumetric efficiency

η_{mh} = mechanical-hydraulic efficiency

η_t = total efficiency ($\eta_t = \eta_v \cdot \eta_{mh}$)

Q = Flow (gpm) or (L/min.)

Torque $T = \frac{V_g \cdot \Delta p}{24 \cdot \pi \cdot \eta_{mh}} \text{ lb-ft}$

Torque $T = \frac{V_g \cdot \Delta p}{20 \cdot \pi \cdot \eta_{mh}} \text{ Nm}$

Power $P = \frac{Q \cdot \Delta p}{1714 \cdot \eta_t} \text{ HP}$

Power $P = \frac{Q \cdot \Delta p}{600 \cdot \eta_t} \text{ kW}$

Fluid

1. Hydraulic Fluid

The MA10V open loop pump in the standard design should be used with a good quality, petroleum based anti-wear hydraulic fluid.

2. Operating Viscosity Range

In order to obtain optimum efficiency we recommend that the operating viscosity by selected from within the range.

At operating temperature

Optimum viscosity (v_{opt}) __80...170 SUS (16 / 36 mm²/s)

Limits of viscosity range

The following values are valid for extreme operating conditions:

v_{min} = 60 SUS (10 mm²/s)

for short periods at max. leakage oil temperature of 93° C

v_{max} = 4600SUS (1000 mm²/s)

1400 SUS (300 mm²/s) on short term cold start

3. Temperature Range

t_{min} = -15°C; t_{max} = +80°C.; t_{min}

4. Filtration

In order to ensure reliable operation of the axial piston unit, the operating fluid must be maintained to a cleanliness class of 18/14 to ISO4406 or NAS 1638 class 9. As a guide the fluid cleanliness level may be achieved using a 10 micron filter.

Installation Information

The pump housing must be filled with clean hydraulic fluid prior to pump start up and remain full.

The concentricity between the prime mover drive shaft and the pump shaft 0.05mm.

Installation Information

Installation Information - *cont'd.*

The installation position of the pump is optional.

The pump housing must be filled with fluid both when commissioning and in operation. In order to achieve low noise levels, all connecting lines (inlet, case drain) should be isolated from the tank by flexible lines.

1. Vertical installation the following conditions should be noted:
 - Before installing the pump inside a tank fill the pump case with fluid
 - Make sure the ports are below the oil level (L), (L1) & S
 - Avoid mounting above the tank whenever possible in order to maintain a low noise level
 - The permissible inlet height is a result of the overall pressure loss "A" may not be greater than 32 inches (800 mm)

2. Horizontal Installation
 - The pumps must be install so (L) or (L1) the case drain is at the top of the pump
 - If the minimum fluid level is below the ports of the pump, pipe the ports L or L1 & S below the minimum oil level.
 - Avoid mounting above the tank whenever possible in order to maintain a low noise level.
 - The permissible inlet height (h) is a result of the overall pressure loss, "A" may not be greater then 32 inches (800 mm).

Below the tank position

- Pipe "L", "L1" and "S" must be mounted below the oil level

DR Pressure Control

The pressure control serves to maintain a constant pressure in the hydraulic system, within the control range of the pump. The pump therefore supplies only the amount of hydraulic fluid required by the actuators. Pressure may be smoothly set at the pilot valve.

METARIS BRAND REPLACEMENT PARTS

Our extensive inventory assures you of prompt shipping of pumps and parts anywhere in the world.

Our parts are 100% interchangeable with OEM products. We are committed to high quality, zero defects, and getting your orders out correctly, and on time.

Whatever your application, Metaris has a high quality replacement product 100% backed by our commitment to service.

We want to be the supplier for all your piston product needs.
